

## **TOPIC Study Details**

Agent: teriflunomide

Treatment mode of action: Immune modulator (reduces immune system over activity)

Study Description/Purpose: An randomized, double-blind, placebo-controlled, parallel group study to evaluate the effectiveness and safety of two doses of teriflunomide versus placebo in people at high risk for MS.

Institution(s): Multiple, worldwide

Type of MS: Clinically Isolated Syndrome (CIS, a single isolated neurological event suggestive of MS and involving loss of nerve – insulating myelin, such as focal weakness, or numbness, or coordination problems, or decrease in vision in one eye)

Number of Subjects: 780

Funding: sanofi-aventis

Website: Go to [www.TheTOPICStudy.org](http://www.TheTOPICStudy.org) for additional details about the study
